

Pioneering insulated panel technology.

A BlueScope Steel Company

May 20, 2008

Metl-Span has introduced Santa Fe™ insulated metal wall panels that feature a heavy embossed metal, stucco texture that mimics the look of masonry stucco finish. The Santa Fe panel has a flat profile, 42" module width and comes in four thicknesses including 2", 2 ½", 3" and 4". Panels are available in standard lengths from 8' to 32' and have an R-value (nominal) of 7.14 per inch.

Exterior and interior facings are G-90 galvanized or AZ-50 aluminum-zinc coated steel in a variety of colors and finishes. The durable metal facings will not crack, flake or deteriorate from water intrusion like most masonry finishes.

Santa Fe's heavy stucco texture is a frequent substitute for stucco masonry in many communities. The panels install in one-step as a single element combining the exterior facing, insulation in-place and interior facing. Installation can be done in almost any weather condition.
