

Pioneering insulated panel technology.

A BlueScope Steel Company

November 11, 2008

As a pioneer in insulated panel development, Metl-Span is constantly striving to improve our product offerings to our customers. Metl-Span has developed a hollow metal door and window system to further complement the exceptional function and performance of the ThermalSafe® fire resistant and CF insulated metal panels.

When used in a ThermalSafe wall, the doors and windows may be fire resistance rated. This is the first and only UL rated system of fire rated doors and windows for walls constructed of mineral fiber insulated panels...another example of Metl-Span's pioneering role in composite panel technology.

The door/window framing system allows standard door and window units provided by the contractor to be integrated within ThermalSafe and CF walls with great flexibility of doors and window types, configurations, size and options.

The Hollow Metal Door/Window System for ThermalSafe & CF Wall Technical Bulletin has been developed providing the system's description, architectural details and installation details. The booklet is for the building designer, specifier and the installer for their understanding of the system and its application.

[To view the booklet on our website, click here.](#) You can download copies and/or request a hard copy from our website "contact" page.
